Chronic sinusitis

- The treatment of chronic sinusitis requires an intensive program of improved nasal hygiene with saline irrigations, antibiotic therapy, treatment of nasal allergies and, sometimes, surgery. Sometimes children with chronic sinusitis have another underlying medical, such as asthma, cystic fibrosis or immune deficiency.
- Pulsatile nasal irrigations are one way to achieve improved clearance of mucus and phlegm in the nose.
- Sinucleanse is a doctor developed system to make saline nasal irrigations easier for children.

Cystic Fibrosis and sinusitis

Many patients with cystic fibrosis have chronic sinusitis and/or nasal polyps. These nasal disorders can be treated by an otolaryngologist as these children often require surgery.
